

Code Checklist					
Project Name	ToDdList-APP				
Reviewed Document	SRS (Software Requirements Specification) Review				
Reviewed Feature/Scope	User requirements specification review, checklist Table J.3, items 1-25				
Number of Pass	10				
Number of Fail	12				
Number of N/A	1				
No.	Checklist Question	Pass	Fail	N/A	Note
1	Are the requirements in compliance with the contract?	☐	☒	☐	No contract or original assignment specification was available in the reviewed document, so compliance with the contract cannot be verified.
2	Have all the requirements been listed?	☒	☐	☐	The document lists the scope, external interfaces, 87 functional requirements, and non-functional requirement groups. However, it should still be cross-checked against the original assignment to ensure no requirement is missing.
3	Are there any ambiguous requirements?	☐	☒	☐	Some requirements remain ambiguous, such as future integrations, real-time behavior, chatbot support, voice calls, and online meetings, because measurable criteria are not clearly defined.
4	Is each requirement described completely?	☐	☒	☐	Many functions include use cases and acceptance criteria, but some areas such as API/schema details, detailed error handling, real-time criteria, and chatbot algorithms are not fully specified.
5	Have the requirements been specified consistently throughout the document?	☐	☒	☐	There are consistency issues: sections 4.16 and 4.17 are both titled 'Forgot Password'; some numbering/formatting lacks spacing; voice/video call scope is mentioned but does not have a clearly defined separate use case.
6	Can the requirements be verified?	☒	☐	☐	Most requirements include main flows, exception flows, and acceptance criteria, so they can be verified. Ambiguous requirements should be improved with measurable verification criteria.
7	Has any additional functionality been included beyond the scope of the contract?	☐	☐	☒	The contract or original assignment was not available, so it cannot be determined whether any functionality is outside the approved scope. Email, Google Calendar, and cloud storage are described as future directions.
8	Are project management requirements included in the requirements?	☒	☐	☐	The document includes priority levels, user roles, acceptance criteria, and a basis for test cases/acceptance testing. A project schedule or resource plan is not included, but that is not usually part of the core SRS.
9	Is the rationale for any derived requirements satisfactory?	☐	☒	☐	Some requirements include justification in the priority section, but the rationale for derived requirements is not explained sufficiently.
10	Are the specified external interfaces compatible?	☒	☐	☐	External interfaces are described for web, mobile, backend, MongoDB, Socket. IO, Flask/Python, Google login, and email. However, versions and API contracts should be added to verify compatibility more rigorously.
11	Are the user interface requirements complete?	☐	☒	☐	The document describes the UI at a general level, including error messages, responsive display, themes, and language settings, but it lacks wireframes, screen states, and consistent validation messages for all functions.
12	Can the requirements be tested? Can the requirements be used directly for validation during acceptance testing?	☐	☐	☐	Many requirements include specific acceptance criteria and can be used to create acceptance test cases. General or vague requirements should be refined with measurable acceptance criteria.
13	Are the performance requirements adequate and feasible?	☒	☐	☐	The document defines a response time requirement of no more than 3 seconds for basic operations, along with pagination and message history limits. These requirements are generally feasible.

Code Checklist					
14	Have the security requirements been determined?	☒	☐	☐	Security requirements are defined, including RBAC, JWT/session handling, password hashing, admin/folder/chatbot access control, prevention of stack trace exposure, and user data protection.
15	Do any requirements conflict with or duplicate other requirements?	☐	☒	☐	There is a duplicate 'Forgot Password' requirement in sections 4.16 and 4.17. Some scope descriptions may also overlap among chat, notifications, meetings, and real-time updates.
16	Is each requirement written in clear, concise, unambiguous language?	☐	☒	☐	Many requirements are clear, but several statements are long or use vague terms such as 'appropriate', 'stable', 'user-friendly', and 'real-time' without measurable definitions.
17	Is each requirement free of content and grammatical errors?	☐	☒	☐	There are formatting and writing issues such as '4.55.Chức năng', '4.81.Chức năng', the duplicated 'Forgot Password' title, and several expressions that need standardization.
18	Are the time-critical functions identified, and are the timing criteria for them specified?	☐	☒	☐	The document mentions real-time behavior and a 3-second performance target, but it does not specify separate timing criteria for chat, notifications, task synchronization, Socket.IO updates, or chatbot responses.
19	Have internationalization issues been adequately addressed?	☒	☐	☐	Internationalization is addressed through requirements for Vietnamese/English language customization, themes, time zone settings, date formatting, and per-account preference storage.
20	Is the format in conformance with the format in the organizational process?	☒	☐	☐	The document follows a standard SRS-like structure: introduction, overall description, external interface requirements, functional requirements, non-functional requirements, use cases, and acceptance criteria.
21	Are all internal cross-references to other requirements correct?	☐	☒	☐	Not all internal cross-references can be confirmed. The duplicate and inconsistent numbering found in some sections indicate that internal references should be reviewed again.
22	Do the requirements provide an adequate basis for software requirement specification?	☒	☐	☐	The document provides an adequate basis for SRS development and test case design, including scope, stakeholders, functions, non-functional requirements, constraints, use cases, inputs/outputs, and business rules.
23	Have algorithms intrinsic to the functional requirements been defined?	☐	☒	☐	Core algorithms and logic for the chatbot, analytics, task suggestion, and task evaluation features are not clearly specified.
24	Is each requirement in scope for the project?	☐	☒	☐	Most requirements fit the ToDoList/collaboration scope, but features such as voice/video calls, online meetings, cloud/calendar/email integrations should be clarified as current scope or future scope.
25	Are all security and safety considerations properly specified?	☒	☐	☐	Security and safety considerations are described, including controlled error handling, no technical error leakage, authorization, authentication, and data protection. Backup/recovery and threat modeling should be added for stronger coverage.
Conclusion	Fully Approved	☐			
	Conditionally Approved	☐			
	Rejected	☒			
Discussion	The reviewed SRS has a clear structure and covers the main requirement areas, including scope, user roles, interfaces, functional and non-functional requirements, use cases, and acceptance criteria. However, some issues still need revision, such as ambiguous real-time/chatbot requirements, duplicated “Forgot Password” sections, inconsistent formatting, incomplete UI details, missing timing criteria, and unclear algorithm definitions. Therefore, the SRS should be conditionally approved after these issues are corrected.
